(a) The theory of special relativity is based on two postulates. One of these postulates is that the speed of light in free space is invariant. State the other postulate.

.....

(1)

- (b) An electron in the Stanford linear accelerator is accelerated to an energy of 24.0 GeV.
 - (i) An electron travelling with this energy has a velocity v.

Show that the value of $\left(1 - \frac{v^2}{c^2}\right)^{\frac{1}{2}}$ is about 2.1 × 10⁻⁵.

(3)

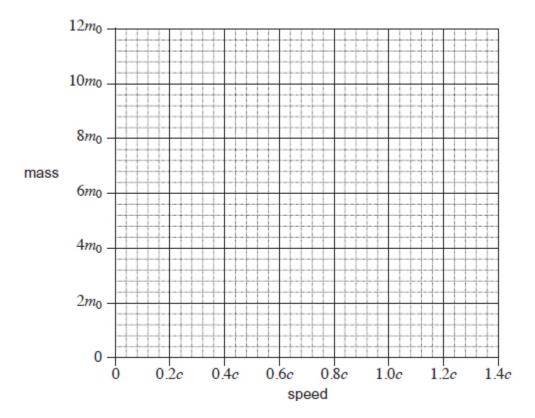

(ii) The Stanford linear accelerator has a length of 3.0 km. Assume that the electron travels for the full length of the accelerator with an energy of 24 GeV.Calculate the length, in m, of the accelerator in the reference frame of the electron.

length of accelerator = m

(1)

(c) Draw a graph to show how the relativistic mass of an electron varies with speed as it is accelerated from rest.

Rest mass of an electron = m_0

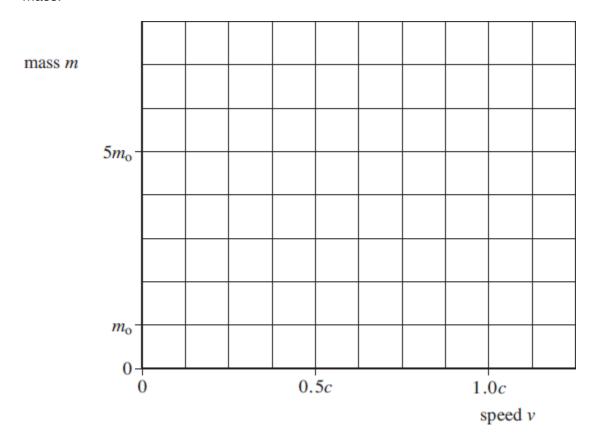

(2) (Total 7 marks) (a) Calculate the speed of a particle at which its mass is twice its rest mass.

(2)

(b) Use the axes below to show how the mass m of a particle changes from its rest mass m_0 as its speed v increases from zero.

Mark and label on the graph the point **P** where the mass of the particle is twice its rest mass.

(3)

(c) By considering the relationship between the energy of a particle and its mass, explain why the theory of special relativity does not allow a matter particle to travel as fast as light.

3	(i)	Calculate the kinetic energy, in J, of a proton accelerated in a straight line from rest through a potential difference of 1.1×10^9 V.
	(ii)	Show that the mass of a proton at this energy is 2.2 m_0 , where m_0 is the proton rest mass.
	<i>(</i>)	
	(iii)	Hence calculate the speed of a proton of mass 2.2 m_0 .

A muon is an unstable particle produced by cosmic rays in the Earth's atmosphere. Muons that are produced at a height of 10.7 km above the Earth's surface, travel at a speed of 0.996 c toward Earth, where c is the speed of light. In the frame of reference of the muons, the muons have a half-life of 1.60×10^{-6} s.

(a) (i) Calculate how many muons will reach the Earth's surface for every 1000 that are produced at a height of 10.7 km.

number of muons	
	,

(3)

(ii) Which of the following statements is correct? Tick (✓) the correct answer.

	√if correct
For an observer in a laboratory on Earth, the distance travelled by a muon that reaches the Earth is greater than the distance travelled by a muon in its frame of reference	
For an observer in a laboratory on Earth, time passes more slowly than it does for a muon in its frame of reference	
For an observer in a laboratory on Earth, the probability of a muon decaying each second is lower than it is for a muon in its frame of reference	

(1)

Show that the total energy of an electron that has been accelerated to a speed of (b) 0.98c is about 4×10^{-13} J. (2) The total energy of an electron travelling at a speed of 0.97c is 3.37×10^{-13} J. (ii) Calculate the potential difference required to accelerate an electron from a speed of 0.97c to a speed of 0.98c. potential difference =V (Total 7 marks) In a particle beam experiment, a pulsed beam of protons at a speed of 1.00×10^8 m s⁻¹ passed 5 through a stationary detector in a time of 15.0 ns. detector (a) Calculate the length of the pulsed beam in (i) the frame of reference of the detector,

theonlinephysicstutor.com

	(ii)	the frame of reference of the protons.	
			(2)
(b)	(i)	Calculate the kinetic energy of each proton in the beam, in J.	(3)
(D)	(i)	Calculate the kinetic energy of each proton in the beam, in 5.	
	(ii)	The beam consisted of 10 ⁷ protons. It passed through the detector and was stopped by a stationary target. Calculate the average power which the proton beam delivered to the target during the pulse.
