Q1.

| Question <br> Number | Acceptable answers | Additional guidance | Mark |
| :---: | :---: | :---: | :---: |
| (i) | - States a value of $\Delta V$ <br> - Uses $\Delta V / \Delta d$ with a difference in distance $\begin{equation*} E=560 \mathrm{~V} \mathrm{~m}^{-1} \tag{1} \end{equation*}$ <br> allow range $500-560 \mathrm{~V} \mathrm{~m}^{-1}$ | Example of calculation: $E=\frac{(80-75) \mathrm{V}}{0.009 \mathrm{~m}}=556 \mathrm{~V} \mathrm{~m}^{-1}$ $\text { (Alt: } 5.6 \mathrm{~V} \mathrm{~cm}^{-1} \text { ) }$ | (3) |
| (ii) | - Line perpendicular to a least 2 equipotential lines <br> - Arrow pointing towards flower |  | (2) |

| (iii) | - States $V \times r=$ constant <br> - One corresponding pair of values of $V$ and $r$ <br> - At least two pairs of values used to show that the product is not constant therefore not radial <br> (MP3 dependent on MP2) | Example of calculation: <br> Using $V=95$ and $r=2.0-$ <br> 2.2: $V r=190-209$ <br> $V=90$ and $r=2.1-2.5: V r=189-225$ <br> $V=85$ and $r=2.5-2.8: V r=212-238$ <br> $V=80$ and $r=3.5-3.8: V r=280-304$ <br> $V=75$ and $r=4.3-4.7: V r=323-353$ <br> $V=70$ and $r=5.8-6.2: V r=406-434$ <br> Using $r=3$ and $V=82-83: V r=246-249$ <br> $r=4$ and $V=77-78: V r=308-312$ $r=5$ and $V=72-73: V r=360-365$ | (3) |
| :---: | :---: | :---: | :---: |

Q2.

| Question <br> Number | Acceptable answers | Additional guidance | Mark |  |
| :---: | :--- | :--- | :--- | :---: |
| (a) | - Replace Work $W$ by force $\times$ distance | (l) | Alternative method: <br> Consider one revolution of axle, Load <br> rises $2 \pi r$ |  |
|  | - Replace distance $\div$ time by velocity $v$ | (l) | Work done $=2 \pi r F$ <br> Time taken $=2 \pi \div \omega$ <br> Power $=$ Work $\div$ time $=2 \pi r F \div 2 \pi / \omega$ to <br> give reqd eq | 4 |
|  | - Use $v=r \times$ Angular velocity | (l) | Recognise $F \times r$ is the moment of $F$ | (l) |

| Question <br> Number | Acceptable answers | Additional guidance | Mark |  |
| :---: | :---: | :---: | :---: | :---: |
| (b)(i) | - Arrow away from + charge <br> Or arrow towards - charge <br> - At least 3 Equipotential lines, <br> perpendicular to field lines <br> - Symmetrical about <br> vertical/horizontal axis and not <br> touching/crossing | (1) | MP3 dependent on lines being <br> perpendicular in MP2 | 3 |

| Question Number | Acceptable answers | Additional guidance | Mark |
| :---: | :---: | :---: | :---: |
| (b)(ii) | - Use of $F=\frac{Q_{1} Q_{2}}{4 \pi \varepsilon_{0} r^{2}}$ <br> - $F=0.036(\mathrm{~N})$ | Example of calculation: $\begin{aligned} & F=8.99 \times 10^{9} \mathrm{Nm}^{2} \mathrm{C}^{-2} \frac{\left(0.1 \times 10^{-6} \mathrm{C}\right)^{2}}{(0.05 \mathrm{~m})^{2}} \\ & F=0.03 \mathrm{~N} \end{aligned}$ | 2 |

| Question Number | Acceptable answers | Additional guidance | Mark |
| :---: | :---: | :---: | :---: |
| (c) | - Use of moment $=F x$ <br> - Expression for correct moment <br> - Use of power = moment of force x angular velocity <br> - Only realistic possibility is pond pump and $P=0.6 \mathrm{~W}$ (calculated answer could also be force and then comparison with $\mathrm{b}(\mathrm{i})$ ) | Show that value gives $3.2 \times 10^{-3} \mathrm{Nm}$ and 0.64 W <br> Example of calculation: <br> Moment $=0.036 \mathrm{~N} \times 0.04 \mathrm{~m} \times 2=2.89 \times 10^{-3} \mathrm{Nm}$ $\begin{equation*} \text { Power }=2.89 \times 10^{-3} \mathrm{~N} \mathrm{~m} \times 200 \mathrm{~s}^{-1}=0.58 \mathrm{~W} \tag{1} \end{equation*}$ | 4 |

Q3.

| Question Number | Answer |  | Mark |
| :---: | :---: | :---: | :---: |
| (a)(i) | W/mg and $T$ correct $F / E /$ electric force correct <br> Example of diagram | $\begin{aligned} & \text { (1) } \\ & \text { (1) } \end{aligned}$ | 2 |
| (a)(ii) | See $T \cos \theta=W$ <br> See $T \sin \theta=F$ <br> Or <br> Draws a correct triangle of forces <br> Correctly labels $\theta$ <br> (if a triangle is drawn it must be a closed polygon with correctly orientated direction of arrows) | (1) <br> (1) <br> (1) <br> (1) | 2 |
| (b)(i) | Records 1pair of values from graph <br> Records 2nd pair of values from graph <br> Use of $F r^{2}$ <br> Shows that $F_{1} r_{1}{ }^{2}=F_{2} r_{2}{ }^{2}$ <br> (accept answers with or without the powers of ten included) <br> Example of answer <br> Ignoring powers of 10 $\begin{aligned} & 115 \mathrm{~N} \times 20^{2} \mathrm{~m}^{2}=46000 \\ & 51 \mathrm{~N} \times 30^{2} \mathrm{~m}^{2}=45900 \end{aligned}$ | $\begin{aligned} & \text { (1) } \\ & \text { (1) } \\ & \text { (1) } \\ & \text { (1) } \end{aligned}$ | 4 |
| (b)(ii) | Uses constant from (b) ignoring powers of ten errors Or uses a pair of values from graph <br> Use of $F=k Q_{1} Q_{2} / r^{2}$ with $1.6 \times 10^{-19} \mathrm{C}$ $Q=7.2 \times 10^{-9} \mathrm{C}$ <br> Example of answer $\begin{aligned} & 100 Q^{2}=46000 \times 10^{-9} \mathrm{~N} \mathrm{~m}^{2} / 8.99 \times 10^{9} \mathrm{~N} \mathrm{~m}^{2} \mathrm{C}^{-2} \\ & Q^{2}=5.12 \times 10^{-17} \mathrm{C}^{2} \\ & Q=7.2 \times 10^{-9} \mathrm{C} \end{aligned}$ | $\begin{aligned} & \text { (1) } \\ & \text { (1) } \\ & \text { (1) } \end{aligned}$ | 3 |
|  | Total for question |  | 11 |

(a) $\quad V$ is inversely proportional to $r$ [or $V \propto(-) 1 / r] \checkmark$ ( $V$ has negative values) because charge is negative [or because force is attractive on + charge placed near it or because electric potential is + for + charge and - for - charge] $\checkmark$ potential is defined to be zero at infinity $\checkmark$

Allow $V \times r=$ constant for $1^{\text {st }}$ mark.
max 2
(b) $\quad$ (i) $Q\left(=4 \pi \varepsilon_{0} r V\right)=4 \pi \varepsilon_{0} \times 0.125 \times 2000$

OR gradient $=Q / 4 \pi \varepsilon_{0}=2000 / 8 \checkmark$
(for example, using any pair of values from graph) $\checkmark$ $=28(27.8)( \pm 1)(n C) \checkmark$ (gives $Q=28(27.8) \pm 1(n C) \checkmark$
(ii) at $r=0.20 \mathrm{~m} V=-1250 \mathrm{~V}$ and at $r=0.50 \mathrm{~m} \quad V=-500 \mathrm{~V}$
so pd $\Delta V=-500-(-1250)=750(\mathrm{~V}) \checkmark$
work done $\Delta W(=Q \Delta V)=60 \times 10^{-9} \times 750$

$$
=4.5(0) \times 10^{-5}(\mathrm{~J})(45 \mu \mathrm{~J}) \checkmark
$$

(final answer could be between 3.9 and $5.1 \times 10^{-5}$ )
Allow tolerance of $\pm 50 \mathrm{~V}$ on graph readings.
[Alternative for $1^{\text {st }}$ mark:
$\Delta V=\frac{27.8 \times 10^{-9}}{4 \pi \varepsilon_{0}} \times\left(\frac{1}{0.2}-\frac{1}{0.5}\right)$ (or similar substitution using $60 n C$
instead of 27.8 nC :
use of $60 n C$ gives $\Delta V=1620 \mathrm{~V}$ )]
(iii) $E\left(=\frac{Q}{4 \pi \varepsilon_{0} r^{2}}\right)=\frac{27.8 \times 10^{-9}}{4 \pi \varepsilon_{0} \times 0.40^{2}} \checkmark=1600(1560)\left(\mathrm{V} \mathrm{m}^{-1}\right) \checkmark$
[or deduce $E=\frac{V}{r}$ by combining $E=\frac{Q}{4 \pi \varepsilon_{0} r^{2}}$ with $V=\frac{Q}{4 \pi \varepsilon_{0} r} \checkmark$
from graph $\left.E=\frac{625 \pm 50}{0.40}=1600(1560 \pm 130)\left(\mathrm{V} \mathrm{m}^{-1}\right) \checkmark\right]$
Use of $Q=30 n C$ gives $1690\left(\mathrm{~V} \mathrm{~m}^{-1}\right)$.
Allow ecf from $Q$ value in (i).
If $Q=60 n C$ is used here, no marks to be awarded.

| Q | Evidence | $\begin{gathered} 1-4 \\ \text { Below Schol } \end{gathered}$ | 5-6 <br> Scholarship | $7-8$ <br> Outstanding |
| :---: | :---: | :---: | :---: | :---: |
| 5(a) | $\begin{aligned} & F_{\mathrm{g}}=\frac{6.67 \times 10^{-11} \times 9.11 \times 10^{-31} \times 9.11 \times 10^{-31}}{R^{2}} \\ & F_{\mathrm{e}}=\frac{8.98 \times 10^{9} \times 1.60 \times 10^{-19} \times 1.60 \times 10^{-19}}{R^{2}} \\ & \frac{F_{\mathrm{g}}}{F_{\mathrm{e}}}=2.40 \times 10^{-43} \end{aligned}$ | Thorough understanding of these applications of physics. <br> OR |  |  |
| (b) | Two in parallel (capacitor and inductor), one in series (resistor). <br> Evidence: <br> Finite current at a zero and high frequency implies resistor in series. <br> Can't have the capacitor in series (at low frequency current would be zero). <br> Can't have inductor in series (at high frequency - current would be zero). <br> Zero current at finite frequency implies infinite impedance - this can happen with parallel branch containing an inductor and a capacitor. | Partially correct mathematical solution to the given problems. <br> AND / OR <br> Partial understanding of these applications of physics. | (Partially) correct mathematical solution to the given problems. <br> AND / OR <br> Reasonably thorough understanding of these applications of physics. | Correct mathematical solution to the given problems. <br> AND <br> Thorough understanding of these applications of physics. |

| Question | Evidence | 1-4 marks | 5-6 marks | 7-8 marks |
| :---: | :---: | :---: | :---: | :---: |
| 6(a) | The values of angular momentum for the hydrogen electron are discrete, which means that the electron can only have discrete values of position or energy. When electrons transition from one energy level value to another, they do not go through all the values in between, which means that the accelerating electron in its orbit does not radiate electromagnetic energy. When the electron transitions from one energy level to another, it either emits or absorbs electromagnetic radiation of a frequency that depends on the size of the energy jump. This means that there will be emission and absorption spectra from the H atom. | Shows some understanding of the underlying physics. <br> AND / OR <br> (Partially) correct mathematical solution to given problem. | A reasonable understanding of the underlying physics. <br> AND <br> (Partially) correct mathematical solution to given problem. | Thorough understanding of the underlying physics. <br> AND <br> Correct mathematical |
| (b) | The attraction is due to the magnetic fields, caused by the movement of electrons in the wires. And currents in wires do not change the charge within the wire (effectively Kirchhoff's current law) - the moving electrons do not increase (or decrease) the number of charges within the wire. |  |  | given problem. |
| (c) | The charged rod attracts opposite charges within the metal sphere, and repels like charges. The attracted charges are closer to the original charge than are the repelled charges, and so the attracted charges experience a larger force than the repelled charges, meaning that there is an overall (net) force of attraction. If the sphere is earthed, the repelled charges will leak away to earth (or be neutralised by charge flow from the Earth), while the attracted charges are locked in place by the rod. The net force of attraction is now increased because there is no longer a repulsion component. |  |  |  |
| (d) | Needs $\varepsilon_{0}=8.854 \times 10^{-12}$ |  |  |  |
|  | Take 1 square meter of capacitor. $C=\varepsilon_{0} \frac{A}{d}=8.8954 \times 10^{-9} \mathrm{~F}$ |  |  |  |
|  | $Q=C V=8.8954 \times 10^{-6} \mathrm{C}$ <br> Number of electrons in this amount of charge $=5.560 \times 10^{13}$ <br> In 1 sq m this number of electrons will each occupy an area of $\frac{1}{5.560 \times 10^{13}}=1.80 \times 10^{-14} \mathrm{~m}^{2}$ <br> The distance between each electron will be approximately $\sqrt{ }$ Area $=1.34 \times 10^{-7} \mathrm{~m}$ <br> This separation is independent of the area of the capacitor. |  |  |  |
